Summary Post

by [Mansour Saeed Mubarak Hamdan Al Hamdani](#) - Friday, 10 October 2025, 8:34 AM

In my first reflection experience focusing on exploring ethical issues in deep learning-based generative AI systems such as DALL·E and ChatGPT, this summary combines peer feedback on Abdulla Almessaibi and Ali Alhammadi, and essential themes on AI ethics, bias mitigation, and responsible innovation issues presented in Unit 9-11. My initial article has also mentioned underlying problems: the transfer of biases based on training data (Zhang et al., 2023), the presence of intellectual property (IP) problems (Al-kfairy et al., 2024), the risk of misinformation through deepfakes (Carnegie Mellon University, 2023), and the lack of transparency in the black box models, privacy issues (TechTarget, 2023), and environmental issues (Wired, 2023). These are in line with the theme in Unit 9 of data-driven inequities and in Unit 10 of scalable harms in deployment.

The reply of Abdulla supported my fears regarding bias continuation and false information, suggesting watermarking of synthetic media (Floridi and Chiriatti, 2020) and pre-deployment fairness audits using multiple datasets (Mehrabi et al., 2021; Bender et al., 2021). This is reminiscent of the demand of the provenance tools to counter the deception, as experienced in DALL·E 3 pilots, and third party ethical boards to hold creators accountable in Unit 11. On IP, my arguments on authorship are responded to when Abdulla recommends opt-in consent and automated attribution (Murray, 2023; Doyle and Senske, 2018) as a governance system that is based on transparency labeling.

Ali continued the conversation into labor displacement by saying that AI is automating creative work (Yakura, 2023), but reduces the needless democratization of the process in the underrepresented creator (Riemer and Peter, 2024). His ideas included reskilling programs (Brynjolfsson et al., 2023) and hybrid fact-checking systems (Vosoughi et al., 2018; Kim et al., 2022), which should be used in addition to the strategies of Unit 10 to collaborate with AI and implement inclusive policies. These lessons support the importance of global regulations in order to strike a balance between innovation and equity.

In general, this conversation demonstrates a dual capability of generative AI: it can do much harm without control, but can bring benefits when actively employed by creating controls (overseeing and educating people and regulating AI), among others (Al-kfairy et al., 2024). Ethical deployment requires the interdisciplinary attention as described in Unit 11 since AI must improve the dignity of society without increasing inequalities.
