Summary Post

by [Mansour Saeed Mubarak Hamdan Al Hamdani](#) - Monday, 6 April 2026, 6:24 AM

In the discourse of AI writers, especially using Hutson (2021) as a reference and the answers that my colleagues gave, there were several central themes that were highlighted, which highlight the possibilities and the dangers of using AI in various writing scenarios. The phenomenon of AI writers, including the ones mentioned by Hutson (2021), is transforming industries and making them more efficient, scalable, and productive, particularly in administrative work, such as report creation and email template writing. Human workers can work on higher-value tasks, whereas AI writers can deal with routine tasks that are information-based (Singh, 2024). Nevertheless, as it has been pointed out by several members of the debate, such systems produce content without actual knowledge, which may lead to the occurrence of hallucinations or creation of false data, particularly in the areas of health, law and public policy (Durt, Froese & Fuchs, 2023). It highlights the significance of effective supervision because AI-based tools are capable of generating realistic, but not factual, information (Panteli et al., 2025).

Creatively, the future of AI writers is bright in terms of assisting writers in creating ideas, addressing writer's block, and improving their productivity. But they also express issues concerning the loss of human creativity or the problem of authorship, specifically copyright of the content (Verma, 2023). The inability to comprehend the text in its true meaning is known as the stochastic parrot problem, and it is an issue that AI cannot understand the content of its text, which is how it jeopardises the quality and originality of the text it generates (Souerdem, 2024).

One of the most important problems that has been raised in the forum is the bias of AI systems. It is possible to introduce bias using biased training data, the result of which will be harmful outputs that support stereotypes and discrimination (Simbeck, 2024). This implies frequent testing, disclosure, and human control to avoid such widespread biased or harmful information (Saeidnia et al., 2025).

The significance of AI literacy, especially among students, was mentioned as a highly crucial preventative step to ensure the lack of excessive dependence on AI technology and the preservation of critical thinking in educational settings (Biagini, 2025). Human-in-the-loop systems in which AI-generated content is reviewed by an editor might also be essential in mitigating the risks of misinformation (Chen et al., 2023).

Summing up, although the advantages of AI writers cannot be denied, particularly when it comes to automating the administrative process and increasing the creativity of creative processes, their application should be controlled. The complex of human skills and AI software, as well as well-developed moral principles, is going to be necessary to reduce the risks of misinformation, bias, and intellectual property issues and to make the use of AI writers in the future safe and effective.
